APPLICANT(S) FOR DO/EO/US

Per-Ola Arvidsson, Mark Divers and Silja Petersen-Mahrt

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

1. ☒ This is a **FIRST** submission of items concerning a filing under 35 U.S.C. 371.
2. ☐ This is a **SECOND** or **SUBSEQUENT** submission of items concerning a filing under 35 U.S.C. 371.
3. ☐ This is an express request to promptly begin national examination procedures (35 U.S.C. 371(f)).
4. ☐ The US has been elected by the expiration of 19 months from the priority date (PCT Article 31).
5. ☒ A copy of the International Application as filed (35 U.S.C. 371(c)(2))
 - a. ☐ is attached hereto (required only if not communicated by the International Bureau).
 - b. ☒ has been communicated by the International Bureau.
 - c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US).
6. ☐ An English language translation of the International Application as filed (35 U.S.C. 371(c)(2)).
7. ☒ Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371(c)(3))
 - a. ☐ are attached hereto (required only if not communicated by the International Bureau).
 - b. ☐ have been communicated by the International Bureau.
 - c. ☒ have not been made; however, the time limit for making such amendments has NOT expired.
 - d. ☐ have not been made and will not be made.
8. ☐ An English language translation of amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)).
9. ☒ An oath or declaration of the inventor(s) (35 U.S.C. 371(c)(4)).
10. ☐ An English language translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371(c)(5)).

Items 11 to 16 below concern other documents or information included:

11. ☐ An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
12. ☒ An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
13. ☒ A FIRST preliminary amendment.
☐ A SECOND or SUBSEQUENT preliminary amendment.
14. ☐ A substitute specification.
15. ☐ A change of power of attorney and/or address letter.
16. ☐ Other items or information:

☐

PRELIMINARY AMENDMENT

Prior to examination, please amend the application as follows:

In the Specification:

On page 4, lines 18-19, delete "2-hydroxypropyl-b-CD" and insert
--2-hydroxypropyl- β -CD--.

On page 6, table of Abbreviations, line 3, column 2, delete "2-hydroxypropyl-b-cyclodextrin" and insert --2-hydroxypropyl- β -cyclodextrin--.

In the Claims:

In claim 4, line 1, delete "any preceding claim" and insert --to claim 1,--.

In claim 6, line 1, delete "any preceding claim" and insert --claim 1--.

In claim 7, line 1, delete "any preceding claim" and insert --claim 1--.

In claim 8, line 1, delete "any preceding claim" and insert --claim 1--.

In claim 9, line 1, delete "any preceding claim" and insert --claim 1--.

In claim 10, line 1, delete "any preceding claim" and insert --claim 1--.

CHEMICAL COMPOUNDS

The invention relates to cyclodextrin as a protective agent for compounds in compound libraries, particularly for use in screening the compound library for biological activity.

5 High Throughput Screening (HTS) is a process in which up to many thousands or more of chemical compounds are assayed in search of biological (or other) activity. Large libraries of chemical compounds are valuable assets of research organisations. Compound libraries are used in the search for agents with novel pharmaceutical, agrochemical or other fine chemical applications and are a valuable source of structural and chemical diversity used
10 in identifying new leads as potential inhibitors of a particular target. Compound libraries may for example contain more than 100,000 different compounds and due to increasingly efficient compound acquisition, either through commercial sources, or by high throughput synthesis, compound libraries with more than 1 million different compounds are now of a typical size in some research organisations. There is a vast variety of targets, and an even greater variety of
15 assay methods. The goal of HTS is to identify "actives", compounds that affect the target in some manner. There are a number of problems set out below which presently hinder the optimal operation of HTS.

The compounds available for testing are called the compound library. The compounds may be hydrophilic, lipophilic, reactive or light-sensitive. The compounds are stored in
20 solution, usually DMSO or a mixture of DMSO and water, to be available for screening. The storage is long-term (e.g. up to 5 years) and the environmental conditions are very variable. Because of the large variety of properties in the compound library, the conditions for storage can not be adjusted to individual compounds and compromises are made to suit most of the compounds and the screening process. For the screening process, the individual compounds
25 are transferred to reaction vessels (e.g. microtitre plates) in small (e.g. sub-microliter) quantities. For performing a biological assay, the compounds are diluted in aqueous solution while adding the biological material, for example enzymes, cells or membranes. A signal is measured, representing the individual biological activity of the compound on that particular target, usually relative to a control (e.g. the biological reaction without compounds).

30 Compromising on storage conditions and the choice of suitable solvent may disqualify many compounds even before they reach the biological assay system. Furthermore, even more compounds may never reach the biological target, because the addition of aqueous solution

causes precipitation of molecules. There is currently no solution to this problem. Progress in screening technology i.e. moving into much smaller assay-volumes reveals another problem. Pipetting of sub-microliter quantities of chemical compounds is now possible, but it is very hard to keep the compounds solubilized, because the solvent rapidly evaporates. Most

- 5 compounds are not easily resolubilized in aqueous solution once the organic solvent has evaporated and consequently the compound is not available to the biological target. The compromise of diluting in aqueous solution prior to the assay leaves one with the problem of precipitation.

- High throughput multiple parallel synthesis (HTMPS) can generate very large
10 numbers of individual compounds, typically 100-5000 per week, but the sample size is usually small, <100mg. Compounds from HTMPS are stored sometimes as dry films or as solutions, usually in dimethyl sulphoxide (DMSO). The dispensing of compounds stored as dry films is often very difficult, and the difficulty increases significantly as the sample size decreases. Compounds stored as solutions can be dispensed quickly and accurately, but some
15 samples are unstable in solution and decompose on prolonged storage, even at low temperatures.

- Increasingly the demands of a compound collection are changing. With the advent of high throughput screening (HTS) a whole compound collection of, for example, 100,000 compounds may be screened in a number of days against a new biological target, using
20 automated or semi-automated procedures. Faced with the need for more rapid dispensing of compounds from the compound collection, the small sample size needed and the large numbers of different sample types existing in a compound collection, current systems of storage and dispensing are increasingly incompatible with modern needs.

- Much of the developing new technology in drug discovery is focussing on
25 miniaturisation. Along with many big advantages offered by miniaturisation technologies, come the problems of compounds drying out of solution (due to the evaporation of sub-microlitre volumes of solvent) and exposure of compound solutions to aqueous conditions before the screening (which can lead to precipitation of the compounds out of solution).

- These problems could prevent the screening of many compound classes, and therefore restrict
30 the benefit of HTS in discovering compounds with useful biological activity.

After the priority date of the present invention, a European patent application from Evotec BioSystems GmbH published on 6Oct1999 as EP 947820. This Evotec publication includes use of cyclodextrins as additives for compound storage.

The present invention is based on the discovery that cyclodextrins can be used as a
5 universal additive to compounds in a compound library to overcome at least some of the problems set out above.

According to one aspect of the present invention there is provided a compound library wherein each compound within the library is stored in the presence of a cyclodextrin. The number of compounds in a compound library which may be stored by the techniques as
10 described herein is not limited by the invention, ideally the invention may be used for storage of compounds in compound libraries where the number of different compounds stored is more than 100, preferably more than 300, preferably more than 10^3 , preferably more than 3000, preferably more than 10^4 , preferably more than 30000, preferably more than 10^4 , preferably more than 10^5 , especially more than 10^6 . Addition of compounds to the library that do not
15 contain cyclodextrin is intended to be within the scope of the present invention provided the library sizes set out above are met with compounds that do contain cyclodextrin.

Preferred compounds are those stored in compound libraries of pharmaceutical, biotechnology or agrochemical companies. Preferred compounds are organic molecules of molecular weight of less than 2000 Daltons, and especially of 1000 Daltons or less.

20 Preferably the compounds within the library are selected from at least 3 chemical classes, more preferably at least 5 chemical classes, more preferably at least 7 chemical classes, more preferably at least 10 chemical classes, more preferably at least 30 chemical classes and especially at least 100 chemical classes. Examples of chemical classes include: acidic, basic and neutral compounds; aliphatic, aromatic and heteroaromatic compounds;
25 carboxylic acids, sulphonic acids, esters, acid halides, amides, amidines, nitriles, aldehydes, ketones, alcohols, phenols, thiols, hydroperoxides, amines, imines, ethers, sulphides and peroxides; and any suitable combination or combinations thereof.

Preferably the cyclodextrin is present at a substantially uniform concentration across the library. A preferred concentration of cyclodextrin is 20-200mM, more preferably at 30-
30 150mM, more preferably at 40-80mM and especially at 45-60mM, and especially at about 50 mM. It will be appreciated that these concentrations refer to the initial concentration upon preparation of a compound for addition to the library and that, over time, the concentration

may increase due to evaporation. It will also be appreciated that for this reason, even when one concentration of cyclodextrin is selected initially, there may be variable concentrations present in the compound library depending on differences in storage time (and therefore extent of evaporation) for individual compounds. Compounds may be purposefully dried before storage or alternatively stored in wet form and natural evaporation (if any) allowed to occur on storage. The Evotec publication states that the compounds must be stored dry (see para 18 of Evotec and the claims).

For the sake of comparison with Evotec, the reader is referred to the following parts thereof which state certain additive concentrations.

para 24: hydroxypropyl- β -CD concentrations of 0.05-4% by weight, 0.05-2% and 0.1-1.5%

Example 1: hydroxypropyl- β -CD concentration of 1.5%.

Example 2: hydroxypropyl- β -CD concentration of 0.1%.

A comparison of concentration units is presented below.

hydroxypropyl- β -CD concentration (mM)	hydroxypropyl- β -CD concentration (% by weight)
20-200	2.8-28
30-150	4.2-21
40-80	5.6-11.2
45-60	6.3-8.4
50	7

15

Therefore the stated additive concentrations herein are novel over Evotec.

One cyclodextrin or a mixture of cyclodextrins may be used, either within a single compound or across the library as a whole. An especially preferred cyclodextrin is 2-hydroxypropyl- β -CD.

20 According to another aspect of the present invention there is provided a method of preparing a compound library of the invention which comprises the addition of a cyclodextrin to each compound within the library. In one embodiment, the library may be stored in wet form.

25 According to another aspect of the present invention there is provided a method of screening a compound library of the invention which comprises assay of at least 100

compounds from the library in the presence of a cyclodextrin. Preferred assays include enzyme, receptor and cellular models.

The addition of CDs to compound libraries solves at least some of the problems faced with known compound libraries as described above. For example, we have discovered that
5 many structurally different compounds within a compound library are protected against degradation and oxidation in the presence of CDs and they can be widely used to enhance solubility of molecules in aqueous solution. Furthermore compounds can be dried in the reaction vessel without losing their biological activity. CD has not yet shown any effects on the biological systems tested: no inhibition or activation due to the CDs could be shown, and
10 no side-effects on signal-detection have been observed so far. Furthermore, CD has not yet shown any negative effects on compound availability in any tested bioassay.

Without wishing to be bound by theoretical considerations, we believe that some of advantages of the invention may be due, at least in part, to the following properties of CDs. CDs are capable of forming inclusion complexes with drug molecules by taking up the
15 molecules in their cavity. The inclusion complex is in equilibrium with the surrounding environment of water molecules, CD-molecules and free drug molecules. The compounds are readily released from the inclusion complex by dilution in aqueous solution, i.e displacing the equilibrium in favour of the free molecules. Formation and dissociation of the inclusion-complex is a rapid process, usually only minutes. For very hydrophobic compounds the
20 equilibrium is first reached after hours or days. CDs are not only used to enhance solubility but also to stabilize compounds both in dry formulations and in solutions. CDs can prevent compounds from hydrolysis, oxidation and also photodestruction by protecting them from a potentially reactive environment. Cyclodextrins have been reviewed by Jozsef Szejtli in Chem. Rev. (1998), 98, 1743-53.

25

30

Abbreviations

CD	cyclodextrin
DMSO	dimethylsulphoxide
2-HP-CD	2-hydroxypropyl- β -cyclodextrin
HTMPS	high throughput multiple parallel synthesis
HTS	high throughput screening
OC	octylcycloside
OTGP	octylthioglucopyranoside
PEG	polyethyleneglycol
SDS	sodium dodecyl sulphate

The invention will now be illustrated by the following non-limiting Examples in which:

- 5 **Figure 1** shows the percentage of compounds retaining their biological activity after different treatments compared with the initial number of biologically active compounds (actives) in DMSO-solution. The compounds were dissolved in DMSO, water or cyclodextrin (40 mM) in DMSO, and used either in liquid or after the liquid has evaporated (dry). Three different assay-methods were used: *Enzyme assay*: Enzyme activity was monitored in an aqueous
- 10 buffer system by absorbance changes. *Receptor assay*: binding of isotopically labelled ligand to membrane preparations in an aqueous buffer system was measured by scintillation. *Cellular assay*: A functional cell response was monitored after induction in aqueous medium by luminescence measurement.

- Figure 2** shows the percentage of compounds retaining their biological activity after different
- 15 treatments compared to the initial number of biologically active compounds (actives) in Cyclodextrin-DMSO-solution (40mM). The compounds were dissolved in Solutol™-DMSO (0.1 mM), Polyethyleneglycol-DMSO (20%), SDS-DMSO (20 mM), Octyl-Thioglucopyranoside-DMSO (20 mM) and Octylcycloside-DMSO (50 mM) and used either in liquid or after the liquid has evaporated (dry). Solutol™ is sold by BASF as nonionic
- 20 solubilizer in paste form for use in human and veterinary injections and is described in the BASF catalogue as "Solutol HS 15: macrogol-15 hydroxystearate produced by reacting 15 moles of ethyl oxide with 1 mole of 12-hydroxystearic acid". The same assays as in Example 1 were used.

Example 1

Compound accessibility after drying and aqueous dilution.

A selection of 80 compounds of known biological activity and poor aqueous solubility
5 were screened in 3 different biological systems (enzyme and receptor binding assays), in the presence and absence of cyclodextrin (40mM 2-HP-CD) in the organic solvent.

The enzyme assay was a peroxidase assay with a chromogenic substrate. The receptor
assay was a G-protein coupled receptor assay performed as SPA™ (Amersham, scintillation
proximity assay technology) with a membrane preparation linked to scintillant beads and a
10 radiolabelled ligand. The cellular assay was a cytokine stimulated monocyte cell-line
providing a measurable luminescent response.

The compounds were exposed to drying conditions and aqueous dilution (conditions
which can cause precipitation of the compounds), and then tested in the biological assays, in a
manner equivalent to the standard HTS process. The results are shown in Figure 1.

15 The findings are as follows:

Increased solubility in aqueous solutions, more compounds stay in solution without
precipitating, resulting in more active compounds identified.

Conserved biological activity after drying in the reaction vessel: compounds that have shown
activity on a certain target loose that activity if the compound dried out due to DMSO
20 evaporation prior to the biological assay. When CD is present those active compounds keep
their activity also after being dried.

Several effects were demonstrated:

- Cyclodextrin itself did not affect the normal functioning of the biological assays tested.
- 25 • In the absence of cyclodextrin the drying conditions of the compounds cause loss of all or
most of the biological activities caused by the compounds
- In the presence of cyclodextrin all of the known biological activities of the compounds
were retained after the drying treatments.

Example 2

30 HTS experiments with 1600 compounds

1600 different compounds screened in the presence and absence of cyclodextrin (2-
HP-CD, 50 mM). These experiments provided further confirmation of the preliminary

observations, although this time with a larger number of compounds, not pre-selected for low solubility properties. The results were not as clear-cut as in the preliminary trials, but still very promising.

Firstly, the cyclodextrin did not adversely affect the biological assays, in common with the first trials. Further, it generally revealed more biological activity of the compounds than was seen without cyclodextrin after drying or aqueous dilution treatments, which could otherwise result in compound loss by precipitation.

Several effects were demonstrated:

Increased bioavailability of compounds for the target: Molecules that did not show activity in the absence of CD, can become active because the bioavailability is improved by CD, making for example lipophilic compounds soluble in aqueous solution.

Increased solubility in aqueous solutions, more compounds stay in solution without precipitating, thus resulting in more active compounds

Conserved biological activity if it is necessary to dilute compounds in aqueous solution prior to the assay: compounds that have shown activity on a certain target may lose that activity due to precipitation if the compound is diluted in aqueous solution prior to the assay. When CD is present those compounds mostly keep their activity because precipitation is prevented.

Comparative Example 1

20 Comparison of Cyclodextrin with other possible protective agents

The same experimental setup as in Example 1 was used to compare the performance of cyclodextrin with other potential protective agents. None of the other agents showed the advantageous properties (e.g. biologically inert, protective in dry conditions) as well as cyclodextrin; see Figure 2.

25 The conclusion was that CD was by a large margin the best protective agent tested.

Claims

- 1 A compound library wherein each compound within the library is stored in the presence of a cyclodextrin wherein the cyclodextrin concentration is 20-200mM.
- 2 A compound library according to claim 1 comprising at least 1000 compounds.
- 5 3 A compound library according to claim 1 comprising at least 10000 compounds.
- 4 A compound library according any preceding claim wherein the compounds are organic molecules of molecular weight of less than 2000 Daltons.
- 5 A compound library according to claim 4 wherein the compounds are organic molecules of molecular weight of less than 1000 Daltons.
- 10 6 A compound library according to any preceding claim wherein the cyclodextrin concentration is 30-150mM.
- 7 A compound library according to any preceding claim wherein the cyclodextrin concentration is 40-80mM.
- 8 A compound library according to any preceding claim wherein the cyclodextrin
- 15 concentration is 45-60mM.
- 9 A compound library according to any preceding claim wherein the cyclodextrin concentration is 50mM.
- 10 A compound library according to any preceding claim wherein the cyclodextrin is 2-hydroxypropyl-b-cyclodextrin.
- 20 11 A compound library according to any preceding claim in wet form.
- 12 A method of preparing a compound library as defined in any of claims 1-11 which comprises the addition of a cyclodextrin to each compound within the library and storage of the compound library in wet form.
- 13 A method of screening a compound library as defined in any of claims 1-11 which
- 25 comprises assay of at least 100 compounds from the library.
- 14 A method according to claim 13 in which the assay is selected from the group consisting of enzyme assay, receptor assay and cellular assay.

A B S T R A C T

CHEMICAL COMPOUNDS

The invention relates to cyclodextrin as a protective agent for compounds in compound libraries, particularly for use in screening the compound library for biological activity. A particular advantage is improved recovery of potential activity of compounds within the library when the compounds have dried on storage.

1. A method of protecting a compound in a compound library from drying on storage, comprising: (a) providing a compound in a compound library; (b) adding cyclodextrin to the compound; and (c) storing the compound in the compound library.

COMBINED DECLARATION AND POWER OF ATTORNEY

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name,

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled CHEMICAL COMPOUNDS, the specification of which

- ☐ is attached hereto.
☐ was filed on as Application Serial No. and was amended on (if applicable).
☒ was described and claimed in PCT International Application No. PCT/SE00/01592 filed on 21 August 2000 and was amended under PCT Article 19 on (if applicable).

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose all information I know to be material to patentability in accordance with Title 37, Code of Federal Regulations, §1.56(a).

I hereby claim foreign priority benefits under Title 35, United States Code, §119 of any foreign application(s) for patent or inventor's certificate or of any PCT international application(s) designating at least one country other than the United States of America listed below and have also identified below any foreign application for patent or inventor's certificate or any PCT international application(s) designating at least one country other than the United States of America filed by me on the same subject matter having a filing date before that of the application(s) of which priority is claimed:

COUNTRY	APPLICATION NO.	FILING DATE	PRIORITY CLAIMED
<u>Sweden</u>	<u>9902988-6</u>	<u>24 August 1999</u>	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No

I hereby appoint the following attorneys and/or agents to prosecute this application and to transact all business in the Patent and Trademark Office connected therewith: Janis K. Fraser, Reg. No. 34,819; William E. Booth, Reg. No. 28,933; John W. Freeman, Reg. No. 29,066; J. Peter Fasse, Reg. No. 32,983; Timothy A. French, Reg. No. 30,175; Eldora L. Ellison, Reg. No. 39,967; John J. Gagel, Reg. No. 33,499; John F. Hayden, Reg. No. 37,640.

Address all telephone calls to Janis K. Fraser, Esq. at telephone number 617/542-5070.

Address all correspondence to Janis K. Fraser, Esq., Fish & Richardson P.C., 225 Franklin Street, Boston, MA 02110-2804.

I hereby authorize the attorneys and/or agents named above to accept and follow instructions from my representative, as to any actions to be taken in the Patent and Trademark Office regarding the above identified application without direct communication between the attorneys and me. In the event of a change in the person(s)

COMBINED DECLARATION AND POWER OF ATTORNEY CONTINUED

from whom instructions may be taken, I will notify the attorneys.
